

NEW YORK FORAGE LEGUME AND GRASS VARIETY YIELD TRIALS SUMMARY FOR 2007 – SEASON TOTALS

J. Hansen*, D. Viands, R. Deubler, J. Neally, E. Thomas, J. Yaeger Department of Plant Breeding and Genetics, College of Agriculture and Life Sciences, Cornell University, Ithaca, NY 14853
<http://plbrgen.cals.cornell.edu/programsandprojects/departamental/foragetest/>

Forage yield trials are planted and harvested annually at Cornell University. Funding for these trials is provided by the companies that submit the varieties/cultivars in the trials, from Cornell University College of Agriculture and Life Sciences, and from Northern New York Agricultural Development Program. Trials are managed for four years; seeding year and three production years.

2007 Growing Season (Figures 1 and 2)

For the state, April and July had cooler than average temperatures (-2.5 degrees F and -1.2 degrees F respectively) and had above normal precipitation (144% and 124% of normal respectively). May, June, August, and September were all higher than normal average temperatures and lower than average precipitation (average of four months: 1.4 degrees F and 66% of normal).

Alfalfa yields for 2007 averaged 5.64 tons per acre dry matter (0.9 tons more than in 2006), red clover yields averaged 3.18 tons per acre dry matter (1.28 tons less than in 2006), and perennial forage grass yields averaged 4.58 tons per acre dry matter (0.73 tons per acre less than in 2006).

Cultivar/Variety Selection

Plant breeders continue to develop new and improved cultivars. Cultivars are continually released and were selected for improved agronomic characteristics such

*jlh17@cornell.edu, 607-255-5043 (Ph), 607-255-6344 (Fax)

as yield, disease and insect resistance, forage quality, etc. Seed cost of improved cultivars can be higher than for other cultivars, but this cost is generally offset when there is improved performance at each harvest over the life of the stand.

In each New York trial, there is not one best cultivar, but rather a group of top-yielding cultivars. Cultivar performance should be critically evaluated by comparing yield with other cultivars in two or more trials that are in the second or later year of production.

Alfalfa (Tables 1 and 2) cultivars for New York are recommended to have resistance (R) or high resistance (HR) to four diseases (bacterial wilt, Verticillium wilt, anthracnose, Phytophthora root rot) and fall dormancy rating should be 2, 3, or 4. Cultivars with higher fall dormancy ratings will go dormant later in the fall. Cultivars with fall dormancy ratings higher than 4 may have unacceptable winter-hardiness for New York, particularly in Northern New York. The trials in Perry and Cobleskill were harvested four times during the growing season. The remaining trials were harvested three times. A limited number of potato leafhopper (PLH) resistant alfalfa cultivars are available for producers to plant. These cultivars are tested in trials that are not sprayed with insecticide.

Red Clover (Table 3) is generally a two-production year crop in New York and is an excellent forage legume for short-rotation fields and for frost-seeding into established stands. For the comparison of varieties, trials of red clover will be harvested in the third production year if the plants in the trial do not severely winterkill after the second production year. This year the second and third production year trials had stand decline due to winter injury and drought.

Birdsfoot Trefoil (Table 3) is a legume that tolerates soils that alfalfa will not be productive on. Birdsfoot trefoil should always be planted in combination with other forages like perennial grasses. Also, birdsfoot trefoil does not tolerate low cutting heights, so it is advisable to leave 5+ inches of stubble in the field.

Grass yield (Tables 4, 5, and 6) trials were fertilized with 200 lb/A ammonium nitrate in early April and after first, second, and third harvests. Forage grass trials are harvested four times between May 20th and

October 10th. Grass yields by species for 2007 are listed in the summary table. Also listed is a visual estimate of percent stand and heading date. Heading date is the calendar date when about 5 heads per plot were visible. Use percent stand, heading date, and yield to select grass varieties that fit your management program.

Grass forage quality estimates from 2006 for the trials planted in 2004 are presented in **Table 7**. Grass forage quality estimates from 2006 for trials planted in 2005 are presented in **Table 8**. Forage quality estimates from 2007 for trials planted in 2005 and 2006 will be available on our web site later in the winter.

We express appreciation to all of our cooperators in allowing us to plant field plot trials of forages on their farms and to our employees for their hard work in harvesting and maintaining field plots.

Table 1: New York Alfalfa Cultivar Yield Trial Results - 2007 Forage Yields

T/A = tons per acre dry matter; 5%LSD = to claim statistically significant yield differences between two cultivars, the yield difference must be equal to or greater than the LSD. CV = A statistical representation of the precision of a trial. Lower is better.

*Disease ratings were provided by source companies, and from standard national tests.

Disease ratings code: HR = High resistance (50% or more of the plants resistant), R= Resistance (31-50% resistant), MR = Moderate resistance

FD = fall dormancy. Fall Dormancy ratings of 2,3 or 4 are recommended for New York State.

Cultivars rated R or HR to BW, VW, and Prr should have sufficient disease resistances to perform well in New York State.

*BW - bacterial wilt, VW-Verticillium wilt, FW-Fusarium wilt, An-Anthracoise, Prr-Phytophthora root rot

Table 4: 2007 Perennial Forage Grass Yield Summary

Ithaca, Tompkins Co., Sown 2004, 2005, 2006

T/A = tons per acre dry matter

Marketing contacts listed in Table 6 page 10

5%LSD = claim statistically significant yield differences between two varieties, the yield difference must be equal to or greater than the LSD.

Heading date is date when 5 heads in a 3.5 x 16 foot plot were visible. Trials were harvested four times per year

Soils: 2004 plantings - Madalin silt loam; 2005 plantings Rhinebeck silt loam; 2006 plantings - Williamson silt loam

Tetraploid perennial ryegrass - Quartermaster, Eurostar, Power, Tonga; Diploid perennial ryegrass - Sierra, GO-ABM, GO-ABS, GO-ABZ;

Intermediate ryegrass - BO-ABV

Table 7: Spring, First Harvest Forage Quality Data for Grass Varieties - 2006 DATA for trial planted in 2004

NDF = neutral detergent fiber, **IVTD** = in vitro true digestibility (48 hour digestion)

RFQ = relative feed quality. First harvest forage RFQ, milk per ton, and milk per acre were predicted by using **MILK2000** from U. of Wisconsin.

Boot Stage is date when 5 heads in a 3.5 x 16 foot plot were visible

Maturity score T=number of nodes; R 0=boot stage, R 1=head partially emerged; R 2=head fully emerged; R 3=peduncle fully emerged.

Ammonium Nitrate was applied at spring green-up and after each of the first three harvests at a rate of 200 lb/A.
