

NEW YORK FORAGE LEGUME AND GRASS VARIETY YIELD TRIALS
SUMMARY FOR 2013 – SEASON TOTALS

J. Hansen*, D. Viands, R. Deubler, J. Crawford, J. Schiller, R. Crawford, Department of Plant Breeding and Genetics, College of Agriculture and Life Sciences, Cornell University, Ithaca, NY 14853
<http://plbrgen.cals.cornell.edu/cals/pbg/programs/departamental/forage/foragetest.cfm>

Introduction Forage variety total season yields from New York in the 2013 growing season are in this report. If yields for each harvest are of interest please review the report titled New York Forage Legume and Grass Variety Yield Trials Summary for 2013 – Harvest and Total Season Summary (available at the website listed above).

Forage yield trials are planted and harvested annually at the Cornell University Agricultural Experiment Station in Ithaca and at other locations in New York State. Funding for these trials is provided by the companies that submit the varieties/ cultivars in the trials, from Cornell University College of Agriculture and Life Sciences, and from Northern New York Agricultural Development Program. Trials of perennial forages are managed for four years; seeding year and three production years.

2013 New York State

Temperature Averages

Month			
	Temperature	Departure	Rank
March	30.7	-1.2	57
April	43.4	-1.1	58
May	57.1	1.8	90
June	64.3	-0.1	58
July	77.7	2.8	113
August	65.7	-1.5	36
September	58.2	-1.4	34
October	50.8	2.7	95

Precipitation Averages

Month				
	Precipitation	Departure	Pct Normal	Rank
March	1.77	-1.29	57%	14
April	3.29	-0.13	96%	65
May	3.97	0.32	108%	84
June	7.72	3.63	188%	118
July	5.01	0.97	123%	105
August	3.79	-0.08	97%	67
September	3.40	-0.59	85%	54
October	3.23	-0.72	81%	58

Rankings are for 119 years between 1895 and 2013. 1=coolest; 119=warmest or 1=driest; 119=wettest.

Cornell University

Alfalfa yields for 2013 averaged 6.3 tons per acre dry matter (1.3 tons more than in 2012), red clover yields averaged 6.8 tons per acre dry matter (4 tons per acre more than in 2012), and perennial forage grass yields averaged 6.8 tons per acre dry matter (2 tons per acre more than in 2012).

Cultivar/Variety Selection

Plant breeders continue to develop new and improved cultivars. Cultivars are continually released and were selected for improved agronomic characteristics such as yield, disease and insect resistance, forage quality, etc. Seed cost of improved cultivars can be higher than for other cultivars, but this cost is generally offset when there is improved performance at each harvest over the life of the stand.

In each New York trial, there is a group of top-yielding cultivars. Cultivar performance should be critically evaluated by comparing yield with other cultivars in two or more trials that are in the second or later year of production.

Alfalfa (Tables 1 and 2) cultivars for New York are recommended to have resistance (R) or high resistance (HR) to four diseases (bacterial wilt, Verticillium wilt, anthracnose, Phytophthora root rot) and fall dormancy rating should be 2, 3, or 4. Cultivars with higher fall dormancy ratings will go dormant later in the fall. Cultivars that have fall dormancy ratings higher than 4 may have unacceptable winter-hardiness for New York, particularly in Northern New York. All of the production year alfalfa trials were harvested three or four times between late May and mid-September. The trial planted in 2010 at Perry NY was not harvested in 2013, however the second production year summary is included in this report. In 2013, a trial was planted in Western New York in Leroy. A limited number of potato leafhopper (PLH) resistant alfalfa cultivars are available for producers to plant. These cultivars are tested in trials that are not sprayed with insecticide (page 5).

Red Clover (Table 3) is generally a two-production year crop in New York and is an excellent forage legume for short-rotation fields and for frost-seeding into established stands. The clover root curculio is a destructive pest on clover, eating the roots and destroying the plants in the later production years.

Birdsfoot Trefoil (Table 3) is a legume that tolerates soils that alfalfa will not be productive on. Birdsfoot trefoil should always be planted in combination with other forages like perennial grasses. Also, birdsfoot trefoil does not tolerate low cutting heights, so it is advisable to leave 5+ inches of stubble in the field.

Grass yield (Tables 4, 5, and 6) trials were fertilized with 315 lb/A ammonium sulfate in early April and after first, second, and third harvests. Forage grass trials are normally harvested four times between May 20th and November 3rd. Brome grass does not tolerate intensive management thus was harvested three times this growing season. Due to rain delays in 2013, some grass trials were harvested just three times instead of four. Grass yields by species for production year trials harvested 2013 are listed in summary **Table 4, page 8-9**.

Also listed is a visual estimate of percent stand and heading date. Heading date is the calendar date when about 5 heads per plot were visible. Use percent stand, heading date, and yield to select grass varieties that fit your forage program.

Grass forage quality estimates from 2012 for the trials planted in 2010 and 2011 are presented in **Tables 5 and 6**. Grass forage quality samples are taken at the first growth only, not at the other three harvests. When grass plants produce seed heads, the seed head stems lower forage quality. Samples from each cultivar are taken on two days – two samples at harvest time (May 24 to May 29 in 2012) and two samples at heading date (May 9 to June 7 in 2012). Forage quality estimates from 2013 for trials planted in 2011 and 2012 will be available late winter.

Table 7 is a summary of grasses planted and harvested in 2013.

See [2013 Cornell Guide for Integrated Field Crop Management](http://www.fieldcrops.org/Pages/Home.aspx) for more detailed management information (<http://www.fieldcrops.org/Pages/Home.aspx>).

We express appreciation to all of our cooperators in allowing us to plant field plot trials of forages on their farms and to our employees for their hard work in harvesting and maintaining field plot.

ALFALFA CULTIVAR YIELD TRIAL SUMMARY - NEW YORK - 2013

Table 1: NY Alfalfa Cultivar Yield Trial Results - 2013 Forage Yields

T/A = tons per acre dry matter; 5%LSD = to claim statistically significant yield differences between two cultivars, the yield difference must be equal to or greater than the LSD.
CV = A statistical representation of the precision of a trial. Lower is better.

2013 Alfalfa Trials to Test Insect Resistant Cultivars; Trials in Ithaca NY

Trials harvested 3 times per production year; 2013 trial on Langford channery silt loam, 2010, 2011, 2012 trials on Williamson silt loam.

*PLH (Potato leafhopper) Damage Score - 1=minor to no damage; 5=severe damage **PLH populations were at moderately severe levels in 2013.**

Oneida VR, 5312, and Vernal are alfalfa cultivars susceptible to potato leafhopper. These cultivars are the check cultivars in each trial.

*Disease ratings were provided by source companies, and from standard national tests.

Disease ratings code: HR = High resistance (50% or more of the plants resistant), R= Resistance (31-50% resistant), MR = Moderate resistance

FD = fall dormancy. Fall Dormancy ratings of 2,3 or 4 are recommended for New York State.

Cultivars rated R or HR to BW, VW, and Prr should have sufficient disease resistances to perform well in New York State.

*BW - bacterial wilt, VW-Verticillium wilt, FW-Fusarium wilt, An-Anthracnose, Prr-Phytophthora root rot

Red Clover and Birdsfoot Trefoil Cultivar Yield Trials- 2013 Ithaca, Tompkins Co.

T/A = tons per acre dry matter; 5%LSD = to claim statistically significant yield differences between two cultivars, the yield difference must be equal to or greater than the LSD.

RED CLOVER Checks are **Marathon and Cinnamon Plus**

Perennial Forage Grass Varieties - 2012 Forage Quality, Maturity and Yield at Spring Growth Boot Stage (See Table 5 below)

For the first two production years of each grass trial sown, samples for forage quality analyses were taken from each grass variety. Two samples were taken at boot stage or when seed heads were first visible. The data from these samples can be used to compare forage quality of varieties at approximately the same stage of maturity, however on different days.

Grasses increase in fiber concentration (%NDF) and decrease in fiber digestibility (%NDFd) by advancing calendar date and by increasing temperatures. Harvest grass at boot stage for optimum forage quality. Choose grass varieties first by species based in species agronomic characteristics, then by date of boot stage based on planned date of harvest, then by yield and forage quality (low fiber, high fiber digestibility). Predictions of milk per acre, milk per ton, and relative feed quality were found to be very highly correlated with %NDF and yield, thus are no longer reported.

Table 5: Spring Forage Quality Data for Grass Varieties

Perennial Forage Grass Varieties - 2012 Forage Quality, Maturity and Yield at Spring Growth at Harvest 1 (See Table 6 below)

Two samples were taken from each variety just prior to first harvest. The data from these samples can be used to compare forage quality of varieties on the same day, but at different stages of maturity. Varieties are sorted from earliest heading date to latest heading date within each trial.

Grass varieties that are harvested prior to boot stage such that the seed heads are not harvested in the first cutting, will have seed head emergence at the second harvest. Varieties with seed heads at second harvest can be expected to have lower forage quality at second harvest compared to a variety that does not have seed head emergence at that harvest. Samples were not taken for analyses at the second harvest.

Table 6: 2012 Spring, First Harvest Forage Quality Data for Grass Varieties
